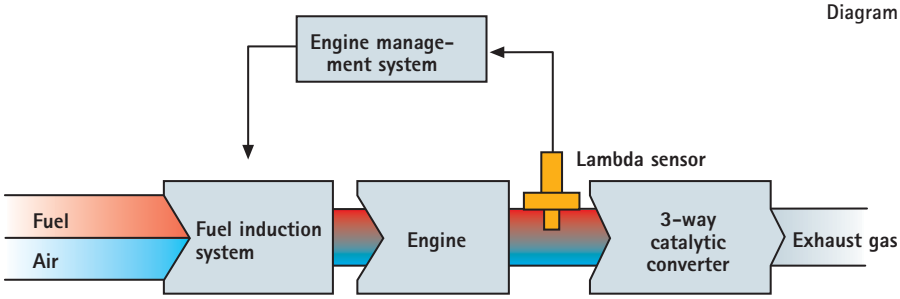
Why are Lambda sensors fitted?

Everyone agrees that the amount of pollution produced by motor vehicles should be reduced. In order to encourage this governments have progressively introduced tougher and tougher exhaust gas emission legislation.
The most popular method used by vehicle manufacturers to reduce vehicle emissions is the three-way catalyst. This device converts the main pollutants in the exhaust gas to less harmful gases. However the three-way catalyst only works efficiently if the air-fuel ratio can be kept within very tight limits. This is where the lambda sensor comes in.

The lambda sensor is typically situated in the exhaust pipe just before the three-way catalyst. The central element of the lambda sensor is exposed to the exhaust gas.
The lambda sensor continuously detects the composition of the exhaust gas. As the output from the sensor changes the ECU instructs the fuel mixing system to alter the mixture strength (see diagram I). This is known as closed-loop control and ensures that the mixture strength is always correct and ensures optimum catalyst efficiently. At the same time driving performance is assured.

Diagram I



How does the Lambda sensor work?

There are two types of lambda sensors. They use different ceramic elements to detect the composition of the exhaust gas.
Zirconia Sensors: The outside of the Zirconia element is in contact with the exhaust gas; the inside is in contact with the air. Both sides of the element are coated with a thin platinum layer. Oxygen ions are able to pass through the element and deposit a charge on the platinum layer. These platinum layers are the electrodes that carry the sensors' signal from the sensor element to the sensors' lead wire (see diagram II).

The Zirconia element conducts oxygen ions above a temperature of about 300°C. Because of the special properties of the Zirconia element a voltage is generated if the oxygen concentration on the two sides of the element are different. A low voltage is produced if the air-fuel mixture is too lean and a high voltage is produced if it is too rich. There is a large change in voltage around = 14.7:1 AFR (see diagram III).

Diagram II

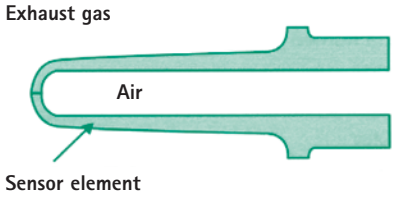


Diagram III

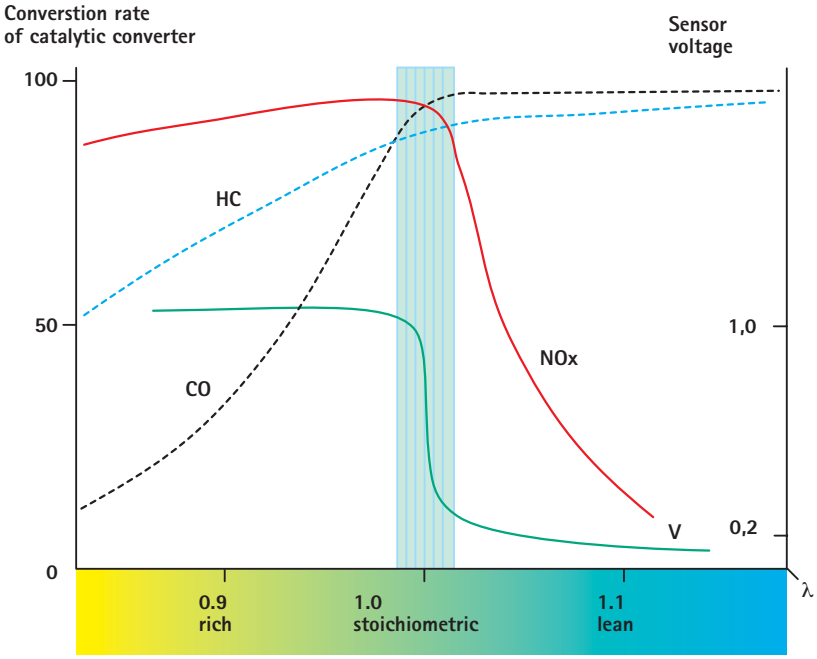
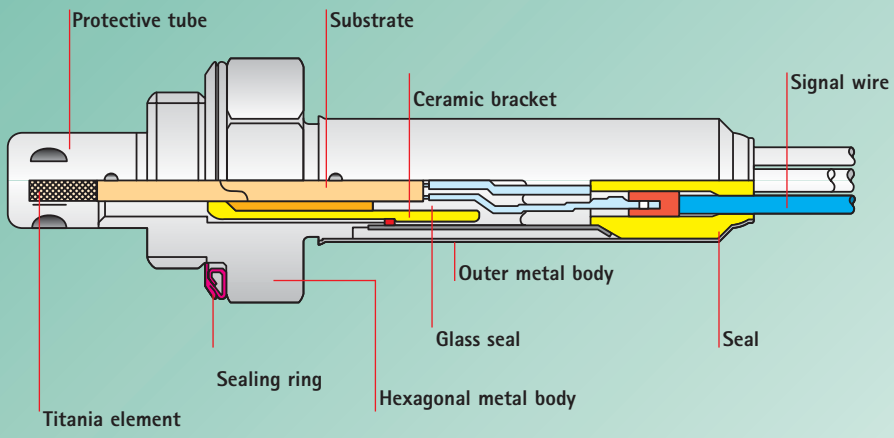


This AFR is known as Lambda (λ) 1.0 and is why the sensors are referred to as Lambda sensors. The ECU uses the voltage produced by the Lambda sensor to instruct the fuel mixing system to strengthen or weaken the mixture. Since the sensor only produces a voltage when the element is above approx. 300°C, it takes the exhaust gas a little while to heat the element up to this temperature after the engine has been switched on. In order to reduce the time it takes for the sensor to start working most sensors today are fitted with an internal ceramic heater. These sensors have 3 or 4 lead wires. NTK's ceramic heaters utilise our long experience in thick film multi-layer technology, ensuring top performance and reliability.



Titania Sensors: The Titania element in these sensors does not produce a voltage like the Zirconia element does. Instead the electrical resistance of the Titania element changes according to the concentration of oxygen in the exhaust gas. There is a big change in the resistance of the element at Lambda 1.0. Therefore when a voltage is applied to the element the output voltage changes depending on the oxygen concentration in the exhaust gas. This signal from the sensor is used by the ECU for closed loop control. As Titania sensors do not need air on one side of the element they can be made smaller and are completely submergible. The sensor element, its platinum electrodes and heater element are all mounted on a ceramic substrate using NTK's thick film multi-layer technology. Titania and Zirconia sensor are not interchangeable due to the difference in size and the different control strategies that are used to interpret the sensor signal.

How to test Lamnda sensors

Failed or worn-out Lambda sensors cause problems such as poor fuel economy, failed emission test, failure of the catalytic converter and poor driveability. Before you can test the operation of the Lambda sensor you will need an oscilloscope. You should first check that the basic engine setup is to the manufacturers' specification. Then thoroughly warm up the engine-remember the Lambda sensor will only function once it is up to temperature.

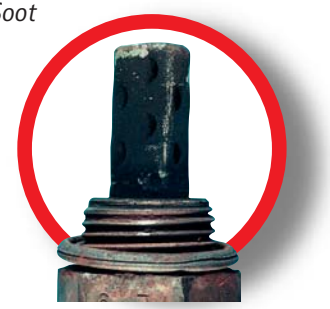
Using the appropriate connecting device, connect the sensor output to your oscilloscope-do not disconnect the sensor from the ECU. Run the engine at approx. 2,000 r.p.m.
A properly functioning Lambda sensor will show a rapidly fluctuating output signal between approximately 0.2 and 0.8 volt. The time taken to change from 0.2 volt to 0.8 volt (lean to rich response time) should be about 300 milliseconds. The rich to lean response time should be similar.
If the sensor output is constant or the response time is too slow the sensor should be changed.
It is a good idea to check Lambda sensor function at every tune-up and before submitting cars for emission tests.
A slow sensor will effect fuel economy.
A new sensor will soon pay for itself by cutting fuel bills.

Visual inspection

Visual inspection by itself is not usually sufficient to determine if a Lambda sensor is functioning correctly. However, the lead wire and connector should be checked for damage. Any damage will interfere with the sensor signal. The sensor body should be checked for evidence of impact demage the mechanical shock of which could have cracked the sensor element. The appearance of the sensors' protection tube can give an indication of possible problems.

Soot

Excessive soot can clog the sensor and affect its response time. The mixture may be too rich or the sensor heater may be damaged. In either case the sensor should be changed.



Oil

Excessive white or grey deposits indicate that fuel additives are being used or the engine is burning oil. Certain components in the fuel additives and oil can contaminate the sensor element. The cause should be rectified and the sensor changed.

Lead

Shiny deposits indicate the presence of lead. Lead attacks the platinum on the sensor element and in the catalyst. The sensor should be changed and only unleaded fuel used.

Why choose NTK Lambda sensors?

NTK are the largest manufacturer of Lambda sensors supplying vehicle manufacturers worldwide. This experience allows us to offer the correct sensor for every vehicle application. Careful attention is paid to ensure that all technical specifications such as element type, heater resistance and connector are perfectly matched to that fitted as original equipment.
As all NTK Lambda sensors are supplied with OEM specification connectors fitted, there is no danger of water penetration interfering with the sensor output.

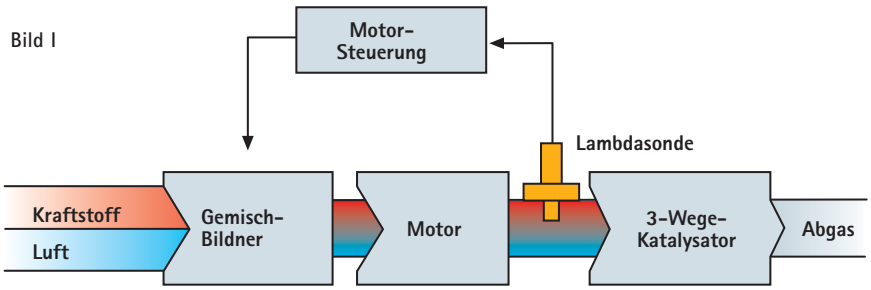
Lambdasonden für optimale Abgasreduzierung

Die Automobilindustrie ist durch die gesetzlichen Abgasvorschriften verpflichtet, die Abgasemissionen zu reduzieren. Deshalb werden heute alle Fahrzeuge mit Otto-Motor serienmäßig mit einem Drei-Wege-Katalysator ausgerüstet. Der Katalysator wandelt die schädlichen Abgase in umweltverträgliche Gase um. Damit der Katalysator effektiv arbeitet, muß das Verhältnis von Kraftstoff und Luft exakt abgestimmt sein. Die Lambdasonde ermittelt kontinuierlich die Zusammensetzung der Abgase. Die Lambdasonde befindet sich im vorderen Teil der Abgasanlage vor dem Katalysator. Sie mißt den Restsauerstoffgehalt im Abgas. Über ein Ausgangssignal regelt sie die Motorsteuerung, die das Kraftstoff-Luftgemisch mit dem Gemischbildner exakt einstellt (vgl. Bild I). Dieser sogenannte geschlossene Regelkreis garantiert ein optimales Mischungsverhältnis. Gleichzeitig stellt er sowohl die optimale Konvertierungsrate des Katalysators als auch die beste Fahrleistung ein. Mit Hilfe einer zweiten Lambdasonde hinter dem Katalysator wird ständig die einwandfreie Funktion des Katalysators und der Vorkatsonde geprüft und Fehler sofort optisch auf dem Armaturenbrett angezeigt.

Bild I

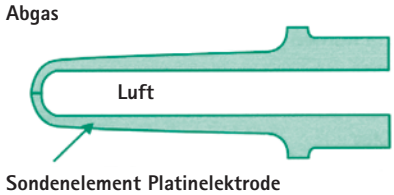


Funktion und Technik

Es gibt unterschiedliche Typen von Lambdasonden. Sie unterscheiden sich durch die keramischen Elemente, mit denen die Zusammensetzung der Abgase gemessen werden.

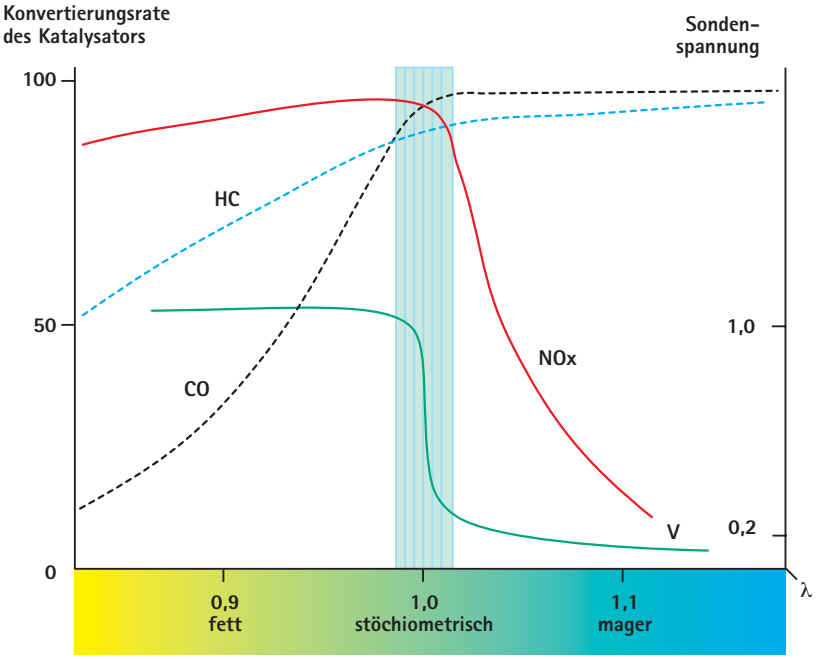
Zirkondioxid-Sonden: Die Außenseite des Zirkondioxid-Elementes steht im direkten Kontakt zum Abgas. Die Innenseite hat Luftkontakt. Beide Seiten des Elements sind mit einer dünnen Platinschicht überzogen. Sauerstoff-Ionen passieren das Element und hinterlassen eine elektrische Ladung auf der Platinschicht. Die Platinschicht fungiert als Elektrode; das Sondensignal wird vom Element zum Anschlußdraht der Sonde weitergeleitet (vgl. Bild II).

Bild II



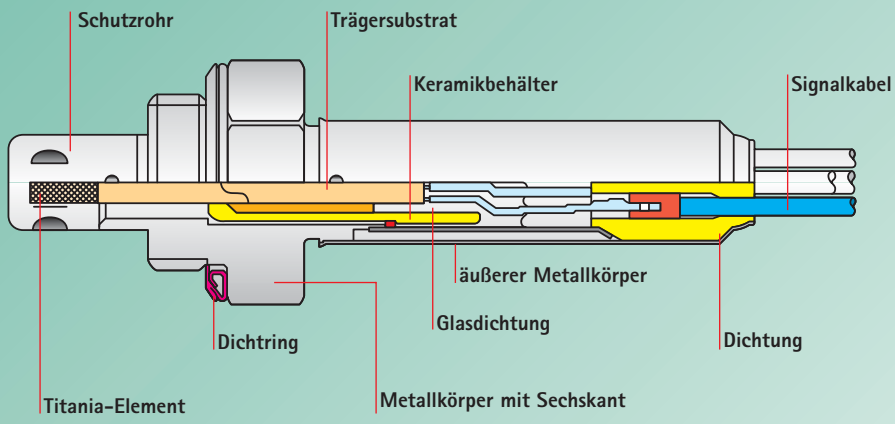
Das Zirkondioxid-Element wird für Sauerstoffionen ab einer Temperatur von ca. 300°C leitfähig. Ist die Sauerstoffkonzentration auf den beiden Seiten des Zirkondioxid-Elements unterschiedlich, entsteht aufgrund der besonderen Eigenschaften des Elements eine Spannung. Bei einem mageren Verhältnis von Kraftstoff zu Luft wird eine geringe Spannung erzeugt. Ist das Verhältnis fett, ist die Spannung hoch. Der charakteristische Spannungssprung findet bei einem Kraftstoff-Luft-Verhältnis von ca. 1:14,7 statt (vgl. Bild III). Dieses Verhältnis kann auch mit der Luftzahl charakterisiert werden (λ = 1 entspricht einem Kraftstoff-Luft-Verhältnis von 1:14,7; d.h. es findet eine vollständige Verbrennung statt).

Bild III



Durch den Gemischbildner reguliert die Motorsteuerung das Verhältnis von Kraftstoff zu Luft. Die hierfür erforderlichen Informationen erhält die Steuerung durch die Lambdasonde. Die Sonde erzeugt erst Spannung bei Erreichen ihrer Betriebstemperatur von über 300°C. Deshalb benötigt das Element nach dem Start des Motors eine gewisse Zeit, bis es durch die Abgase aufgeheizt ist.

Die meisten Sonden verfügen heute über einen internen Keramikheizer, der die Zeitspanne verkürzt, bis die Sonde ihre Arbeit aufnehmen kann. Die beheizten Sonden von NTK sind ein Beispiel für die langjährige Erfahrung auf dem Gebiet der Dickfilm-Mehrschicht-Technologie. Sie bieten die Garantie für Qualität und Zuverlässigkeit



Titandioxid-Sonden: Das Titandioxid-Element erzeugt keine Spannung wie das Zirkondioxid-Element. Statt dessen ändert sich der elektrische Widerstand des Titandioxid-Elements in Abhängigkeit von der Sauerstoffkonzentration im Abgas. Bei Lambda 1,0 findet eine starke Veränderung des Widerstandes statt. Wird eine Spannung an das Element angelegt, ändert sich die Ausgangsspannung entsprechend der Sauerstoffkonzentration im Abgas. Die Titandioxid-Sonde benötigt im Vergleich zur Zirkondioxid-Sonde keine Referenzluft, da sie sich im Wirkmechanismus unterscheidet. Deshalb fallen auch die Abmessungen der Titandioxid-Sonde kleiner aus. Das Sondenelement, seine Platinelektroden und das Heizelement werden mit der Dickfilm-Mehrschicht-Technologie von NTK auf einem Keramiksubstrat aufgebaut. Sonden aus Titandioxid und Zirkondioxid sind aufgrund ihrer unterschiedlichen Größe und Steuerstrategien, die zur Auswertung des Sondensignals verwendet werden, nicht austauschbar.

Funktionstests

Ausgefallene oder defekte Lambdasonden verursachen Probleme wie z.B. hohen Kraftstoffverbrauch, Ausfall und Beschädigung des Katalysators, schlechtes Fahrverhalten oder das Nichtbestehen des Abgastests. Lambdasonden werden mit einem Oszilloskop getestet. Vor Testbeginn ist sicherzustellen, daß der Motor nach den Angaben des Herstellers eingestellt ist. Danach muß der Motor auf Betriebstemperatur warmlaufen, da die Lambdasonde nur funktioniert, wenn sie die richtige Temperatur erreicht hat.

Mit der entsprechenden Anschlußvorrichtung wird der Sondenausgang an das Oszilloskop angeschlossen. Die Sonde darf nicht von der Motorsteuerung getrennt werden. Die Motordrehzahl sollte bei ca. 2.000 U/min liegen. Wenn die Lambdasonde richtig funktioniert, zeigt sich ein Spannungssprung zwischen ca. 0,2 und 0,8 Volt. Die Zeit, die für den Anstieg von 0,1 Volt auf 0,9 Volt benötigt wird (Reaktionszeit „mager-fett"), sollte ca. 300 Millisekunden betragen. Die Reaktionszeit „fett-mager" liegt im gleichen Bereich.

Wenn der Sondenausgang konstant oder die Reaktionszeit zu langsam ist, muß die Lambdasonde ausgetauscht werden.

Die Funktion der Lambdasonde sollte bei jeder Inspektion und jeder Abgasuntersuchung auf ihre Funktion überprüft werden.

Eine langsame Sonde erhöht den Kraftstoffverbrauch und ist deshalb zu ersetzen.

Sichtprüfung

Sichtprüfung alleine reicht nicht aus, um die Funktionsfähigkeit einer Lambdasonde festzustellen. Sowohl Anschlußleitungen und Stecker als auch der Sondenkörper sind zu kontrollieren, denn auch Abweichungen in diesen Bereichen verfälschen das Sondensignal. Beschädigungen des Sondenkörpers sind ein Zeichen für mechanische Stöße.
Auch der Zustand des Sondenschutzrohres kann Aufschluß über mögliche Fehlfunktionen geben.

Russ

Starke Rußablagerungen führen zur Verstopfung der Sonde und beeinträchtigen die Reaktionszeit. Das Kraftstoff-Luftverhältnis kann zu fett oder der Sensorheizer beschädigt sein. Auf jeden Fall sollte die Sonde gewechselt werden.

Öl

Starke weiße oder graue Ablagerungen weisen darauf hin, daß Kraftstoffzusätze verwendet werden oder der Motor Öl verbrennt. Bestimmte Komponenten in den Kraftstoffzusätzen und im Öl verschmutzen das Sondenelement.
Die Ursache ist zu beseitigen und die Sonde auszutauschen.

Blei

Glänzende Ablagerungen sind ein Hinweis auf Blei im Kraftstoff. Blei greift das Platin auf dem Sondenelement und im Katalysator an. Die Sonde muß ersetzt werden. Nach dem Wechsel ist unbedingt auf die ausschließliche Verwendung von bleifreien Kraftstoffen zu achten.

NTK Lambdasonden
Sicherheit durch Qualität

Das Ergebnis langjähriger Erfahrung: Weltweit ist NTK Marktführer.
Diese langjährige Erfahrung bei der Entwicklung und Herstellung von Lambdasonden macht es NTK möglich, die richtige Sonde für nahezu jedes Fahrzeug anzubieten. Alle Bauteile, Elementtypen, Heizwiderstände und Anschlußverbindungen entsprechen den Originalausführungen der Hersteller und ermöglichen eine leichte und problemlose Montage.

HANDLING INSTRUCTIONS
- Read enclosed instructions before installation.
- Do not use sensor if it has been dropped.
- Do not store under high temperature and/or high humidity conditions.

INSTALLATION INSTRUCTIONS
- This sensor is designed for the use in automobiles only.
- Use the correct part number as listed in the application cataloque.
- Do not use sensor if it has been dropped.
- Remove protection cap just prior to installation.
- Firstly install sensor body ensuring lead wire is not twisted or bent.
- Do not use impact wrench or socket type wrench to install sensor.
- **M18 sensors - install finger tight then 1/2 - 3/4 turn with a wrench (35 ~ 45 Nm).**
- **M12 sensors - install finger tight then 3/4 - 1 turn with a wrench (18 ~ 23 Nm).**
- Then connect and route lead wire as originally installed.
- Do not allow lead wire to touch exhaust manifold or any other hot component.
- Do not expose this produd to water, oil, windshield cleaner, anti-corrosion oil, grease, terminal cleaner etc.
- Do not use leaded fuels, silicone or metal based additives.
